Project Title	Meetly: Group Event and Meeting Planner

Project Scope

Meetly is a website developed using the MERN stack (MongoDB, Express.js, React, and Node.js). It is designed to simplify the coordination of group activities such as social gatherings, team meetings, and study sessions, which are commonly organized through scattered messages in group chats.

An organizer creates an event, proposes a set of possible dates, times, and venues, and shares a unique link with the participants. Participants vote on the options, and the system displays the results in real time. Once the organizer finalizes the event, participants can confirm their attendance and submit their preferences, and the organizer receives a consolidated summary. The project will demonstrate user authentication, RESTful API design, database modeling, and the development of a responsive user interface.

Main Functionalities

- User registration and login using JSON Web Token (JWT) authentication.
- Creation of events of different types (hangout, meeting, study session, or other) with a title, description, and multiple date and time options.
- Support for multiple venue options, including physical locations and online meeting links, **integrated with Google Maps (or a similar maps service) so that venues can be viewed freely on a map.**
- A unique shareable link for each event, **which prompts participants to sign in before interacting. The system will use the authenticated participant's details instead of redundantly prompting them to enter their name.**
- Voting on dates and venues, with live vote counts and the leading option highlighted.
- Ability for the organizer to close voting and confirm the final date, time, and venue.
- Attendance responses (attending, not attending, or maybe) with a participant list visible to the organizer.
- Collection of participant preferences, such as food choices, after the venue is finalized, with a consolidated summary for the organizer.
- Optional agenda for meetings, managed by the organizer.
- A dashboard displaying upcoming and past events for each user.
